

A

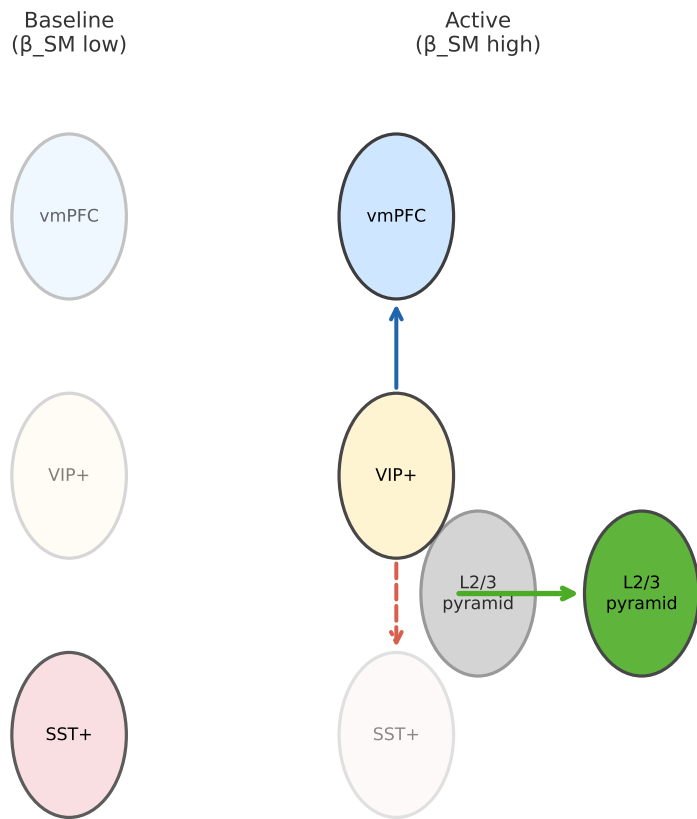

A — Laminar column
(receptor/afferent assignments)

Proposed circuit — causal dissociation requires
optogenetic/chemogenetic validation (§6.2, Gap 1)

B

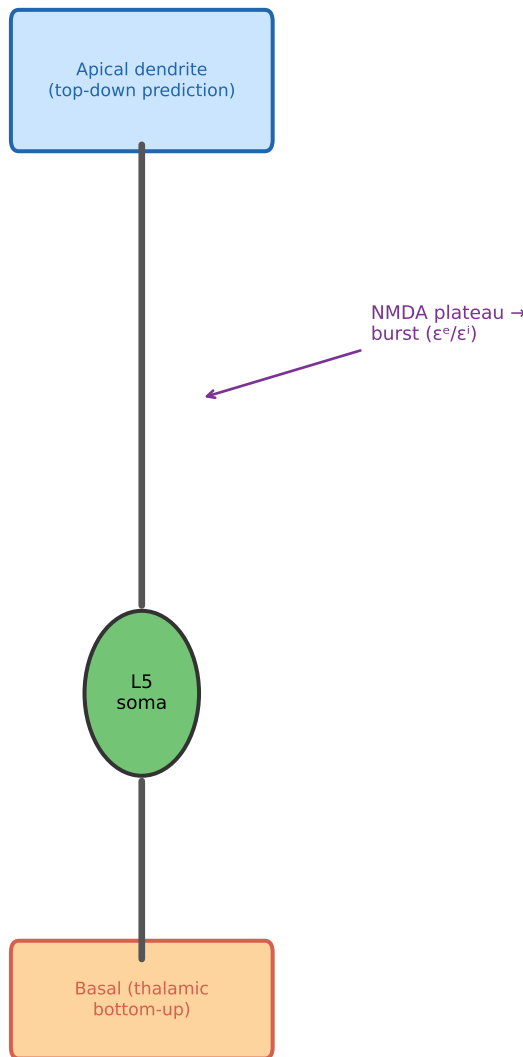

B — vmPFC→VIP+→SST+ disinhibition
(baseline vs. active)

$$\Pi_{\text{eff}}^i = \Pi_{\text{baseline}}^i \cdot \exp(\beta_{\text{SM}} \cdot \hat{M}(c, a))$$

C

C — L5 pyramidal: apical/basal
mismatch → burst signal

Thalamic/caudate substrates not
transcranially accessible (§5.3)

Abbreviation key — vmPFC, ventromedial prefrontal cortex; PV⁺/SST⁺/VIP⁺, parvalbumin/somatostatin/vasoactive intestinal peptide-positive interneurons; ACh, acetylcholine; NE, norepinephrine; $\hat{M}(c, a)$, somatic-marker estimate; ϵ^e/ϵ^i , exteroceptive/interoceptive prediction error.
